

# openMemo

Read me first. Installing is one drag, and getting past the first launch is one line or four clicks.

---

## Install

Drag **openMemo** onto the **Applications** folder in this window. That is the whole install.

## Then macOS blocks it once, and that is expected

openMemo is not notarised, because notarising needs a paid Apple developer account this project does not have. macOS refuses the first launch of every app it cannot check, and makes you allow it by hand. Nothing is wrong with the download.

## The one line way

A browser marks what it downloads with a hidden quarantine tag, and that tag is what macOS reacts to. Remove it and openMemo simply opens. Copy this line, paste it into **Terminal**, press return:

```
xattr -dr com.apple.quarantine /Applications/OpenMemo.app
```

Terminal lives in **Applications/Utilities**, or press Command-Space and type its name. The line prints nothing when it works, which is the normal outcome. Run it again after each update.

## Or click through it, four steps

### 1 Open openMemo from Applications

macOS refuses, and this dialog offers no way through. Click **Done**. Do not click Move to Bin.

#### “OpenMemo” Not Opened

Apple could not verify “OpenMemo” is free of malware that may harm your Mac or compromise your privacy.

Done

Move to Bin

### 2 Open System Settings, then Privacy & Security

Apple menu, **System Settings**, **Privacy & Security** in the sidebar. Scroll down to **Security**. openMemo is named there, with a button beside it. Click **Open Anyway**.

That line only appears after step 1, and it fades after a while. If it is not there, try opening the app again.

### 3 Confirm with Touch ID or your password

macOS checks that you own the Mac. Use Touch ID, or click **Use Password** and type your account password.

### 4 Say yes one last time

A final dialog appears, this one with a way through: same wording as step 1, now with an **Open Anyway** button on it. Click that. openMemo starts, and it starts normally from now on.

# openMemo

After the first launch.

---

## If you set a PIN lock

The lock keeps its PIN in your macOS login keychain, and the keychain recognises apps by their signature. openMemo signs itself rather than paying Apple to, so every build looks like a new app to the keychain. The first launch after an install or an update asks for your **login password**. Type it and choose **Always Allow**, and the PIN keeps working.

**If you click Deny**, the lock screen rejects the correct PIN, because openMemo can no longer read what it stored. Quit openMemo, delete the `lockEnabled` and `lockBlob` lines from `~/Library/Application Support/OpenMemo/openmemo-desktop.json`, then set a new PIN in Settings.

## Updating later

openMemo checks GitHub for new versions and offers to download the new `.dmg` for you. When one arrives:

- 1 Quit openMemo first**  
Command-Q, not just closing the window. The backend holds the database open.
- 2 Drag the new openMemo onto Applications and replace**  
Finder asks whether to replace. Say yes.
- 3 Allow it again**  
A fresh download carries a fresh block, so page one applies to every update, not only the first install. The one line is the quickest way through it:

```
xattr -dr com.apple.quarantine /Applications/OpenMemo.app
```

## Your library is not inside the app

Everything you keep lives in `~/Library/Application Support/OpenMemo/`. Replacing the app replaces the program and nothing else. Memos, media, settings and your PIN stay where they are, and openMemo copies the library into its `backups` folder before the first launch of a new version.

**Never delete that folder to reinstall cleanly.** That folder is your library. Throwing away the app is harmless. Throwing away that folder is not.
